

BACKUP SYSTEM OPTIMIZATION + IMPLEMENTATION

Standard nightly backups still remain an integral part of any DR solution.

While many times overlooked as a component of modern DR plans the fact remains that in most cases backups utilizing media that is taken offsite is often the last line of defense before crucial data may be lost. Recent trends and innovations have led to a multitude of new backup and recovery technologies.

Hedgecon has extensive experience in designing and implementing data and application backup solutions. We've completed a wide range of projects from SMB systems through systems in the multiple petabyte range. A small sampling of the technologies we have experience with are tape, disk, VTL, deduplication, snapshots, hot application backups and off-host backup processing. In virtualized environments we have experience deploying VMware VCB in virtualized environments. Many of the abovementioned technologies can be combined to create a solution that meets your specific needs.

Our offerings include:

- > Designing and sizing backup solutions
- > Merging independent backup systems
- > Backing up virtualized environments
- > Upgrading backup systems
- > Optimizing configurations and data transfer rates to shorten backup windows
- > Streamlining backup processes

39%

of customers have
switched vendors
because they felt their
computer systems
were unreliable.
