

DISASTER RECOVERY + BUSINESS CONTINUANCE WORKSHOPS

Our DR workshops educate your staff on what can be done to enhance your business's ability to prepare for and recover from a disaster.

Our objective is to ensure that you and your staff are informed of the current technologies that can be used to create robust business systems. We will review the current technologies available to you from both Disaster Recovery and Business Continuity perspectives and discuss what can be implemented based on your existing equipment investment. We will address the key components of a Comprehensive DR plan and create an outline appropriate to your business. Information on bridging the gap between unrealistic expectations and what can be reasonably implemented will be presented. On the final day we will review components of the existing environment and map out DR options that we suggest should be implemented to enhance your business's robustness and stability.

- > Review of current industry trends
- > Current DR technologies
- > Idealism vs realism
- > DR testing procedures
- > End user connectivity and redirection
- > Chain of command

44%

of executives believe
that people are the
reason that Disaster
Recovery tests fail.
